Bitcoin.org is a community funded project, donations are appreciated and used to improve the website. Joe Hindy / Android AuthorityCryptocurrency took off in a big way over the last couple of years. People made millions off of Bitcoin, Doge, and Ethereum. New crypto is minted every day and while most of them are arguably scams, some of them have some real promise. Of course, the rise of crypto popularity means there are a lot of crypto wallets available. Not all of them are good, but some do the job quite well. Here are the best crypto wallets for Android.We'd like to give an honorable mention to Phantom (Google Play). It's a new wallet that works on the Solana ecosystem and it has a lot of potential to be a good one. The best crypto wallets for Android Bitcoin Wallet is a fairly basic, but functional crypto wallet. The app lets you buy, sell, and store BTC, BCH, and ETH. You can also send and receive the crypto at your leisure. Some other features include swapping between currencies, a live market data widget for the home screen, customizable network fees, and more. The fees can be a bit unfortunate, but it works well for what it does. Coinbase is an exchange for crypto, but you can also house and transfer crypto to and from it. The app works as almost like a brokerage but for crypto. You can keep track of the prices of many currencies, even if you can't buy all of them from Coinbase. It does let you buy plenty, though, including the big ones like Doge, BTC, and ETH. The verification process can take ages and that's probably our biggest complaint about Coinbase. Coinami Wallet is a functional crypto wallet with plenty of features. It supports every crypto based on ERC20/223/723, Omnilayer, NEM, BEP2, and TRC10. That makes it an excellent wallet for folks looking to store a bunch of different kinds of coins. The app also a clean UI, above-average security, multi-seed support, a DApp browser, and more. There is very little wrong with this one and we consider it one of the best in the business for crypto wallets. Joe Hindy / Android AuthorityEclair Mobile is a Lightning Network compatible Bitcoin wallet. The app has a simple, good-looking UI, and the ability to specify the channels you want to use. It only supports Bitcoin, but it's a great app for people who are really into Bitcoin. We hope the developers add support for other crypto eventually, but for not it works exceedingly well aside from some minor, cosmetic bugs. Joe Hindy / Android AuthorityElectrum is one of those apps where it works really well, but only if you need what this app offers specifically. It has some good security features like local encrypted security keys that never leave your phone. The app also loads quickly and has redundant servers to reduce downtime to virtually zero. It also supports cold storage if you need that. The app has some translation issues if you speak something other than English and the UI could use a little work, but it's otherwise good. Exodus is one of the more popular crypto wallets. It also does almost everything right. It supports dozens of coins, lets you swap between them, and you can send and receive crypto straight from the app. That covers most of the basics for crypto wallets. The app also encrypts your private keys on the device so no one can steal them. The app can be a bit slow on busy days, but honestly it's otherwise fantastic. Gemini operates as both a wallet and an exchange. You can buy, sell, and store various coins, including Bitcoin, Ethereum, Doge, Bitcoin Cash, and various others. It forces 2FA on every account for added security and it lets you do things like set price alerts so you know when to buy or sell. Finally, it comes with Wear OS support, one of the few apps that do this natively in this space. Joe Hindy / Android AuthorityMycelium Bitcoin Wallet is a stable wallet with some decent features. It supports multiple coins, including ETH, ERC-20, and several others. The app also has good security with 100% control over your private keys, fast connection to nodes, and the usual stuff like sending and receiving currency. The UI isn't much to look at, but it's easy enough to use once you get used to it. This one also supports hardware solutions like Ledger and Trezor in case you want to take that extra step. Trust Wallet is one of the most popular crypto wallets on mobile. It supports the usual stuff like ETH and BTC along with ERC20, BEP20, and ERC721 tokens. You can also add currencies the app doesn't support as long as you have the proper links. Finally, you can buy crypto from this app, although sometimes they run out if it's a particularly busy day. Some other features include a DApps browser, the ability to send and receive crypto, and more. Brokerage apps like SoFi (linked at the button) and Robinhood (Google Play) allows you to buy and sell cryptocurrency. However, this is a lot different than something like a true crypto exchange or a wallet app. You buy the crypto and it'll store it for you until you decide to sell it. Thus, it treats crypto like a stock in the stock market rather than a resource you own. It's fairly difficult to get your crypto out of these kinds of places. On the other hand, it's wicked easy to buy and sell so it's easier to play the market. Plus, these services use fewer fees. Depending on your intentions, a solution like this may be viable for trading crypto, but we recommend checking out a real crypto wallet first. Joe Hindy / Android AuthorityAnother solution is to bypass the need for an app altogether and go with a hardware wallet. These hardware wallets keep track of your crypto for you and are the safest way to do so at the time of this writing. There are a few companies with good products, including Ledger (linked at the button) and Trezor. You can find other options with a few Google Searches. There are apps that let you transfer your currency in and out of a physical wallet like this one and some wallets, like Mycelium, that can interact with them directly. These physical crypto wallets can get pricy, but it's the most secure method for storing crypto right now. Joe Hindy / Android AuthorityIf you are having trouble deciding, bitcoin.org has a tool that can help you figure out which wallet to go with. The tool asks you questions like the operating systems you use, explores whether a hardware option is better for you, and even asks for things like your experience level. It'll also ask what's most important to you so it shows you apps with those features. Every app listed on this list can also be found here depending on which criteria you pick. It's definitely worth a try if you need additional help deciding. Secure, manage, and exchange your cryptocurrency with the mobile security of face or fingerprint scanning.See the full listExodus mobile encrypts private keys and transaction data on your mobile device for your eyes only. Your data remains private - no registration or account setup required.By using your 12-word backup phrase you can control your wealth on your mobile device and sync to your desktop. Exchange in seconds on your mobile device with transactions that mirror your desktop.We won't leave you out on your own. Exodus provides an online help desk and 24/7 customer support to get your questions answered, fast.Now you can trade your cryptocurrency in a few taps. Want to exchange Bitcoin for something new? Exodus hides the complex details while assets are exchanged behind the scenes in seconds.Exodus makes it fun and easy to learn and use cryptocurrencies. No "tech speak" or confusing steps. Control your wealth with ease - and have fun doing it!Purchase your favorite cryptocurrencies within Exodus mobile, anytime, anywhere. Pay with credit/debit card, bank transfer, and Apple Pay. Once purchased, your crypto is yours to own. Buy or swap crypto at great rates and minimal fees. Store and manage your assets safely and securely across platforms. Connect any compatible wallet with our Bitcoin debit card or buy gift cards to start spending your crypto. Users may connect other cryptocurrency wallets within the BitPay app including Metamask, Trezor, Electrum, Ledger, Coinbase, Exodus, Kraken, Bitcoin Core, Trust Wallet, and many more. Jordan Tuwiner Last updated July 24, 2022 - Now that you have chosen a wallet, let's transfer some funds into it. In this brief walkthrough, we will show you how to add funds to your Android wallet For you to add funds to your Android Wallet, you will need to find a cryptocurrency exchange to buy crypto and then transfer it to your hardware wallet using an android app as the interface. Many Android hardware wallets have crypto exchanges native to them (as seen above), however, these exchanges generally charge very high transaction fees for the convenience, so it's generally better to use a dedicated crypto exchange, like Kraken or Coinbase. You'll need to choose an exchange that services your country and/or state. You can find a full list of exchanges sorted by country and preferred payment method on our exchange finder. After you have bought your cryptocurrency, such as bitcoin(BTC), ethereum(ETH), or other coins, you'll need to send it to your wallet by following these steps: 1. Open your wallet and find an option to "receive" In this example, we are using a Ledger Nano X with Ledger Live. 2. Connect Your Hardware Wallet 3. Copy the address given or scan the QR code and confirm on the device. 4. On your exchange where you bought your coins, select the "send" option. 5. There should be a field to input your wallet address copied in step 3. Paste it there. 6. Confirm you want to send your coins. After that, you should receive a confirmation with a transaction ID of some kind. Here is what that might look like. What a transaction ID looks like (the number starting with "804") Now that we've got our Android wallet set up with a hardware wallet, let's explore a few additional points on security. PINs, VPNs, and Steel wallets are great additions to our security stack. Always set up a PIN to protect your funds Make sure your Android device and hardware wallet is protected by a 4 to 8 digit PIN number. Much like your bank account, most wallets have a PIN password that is the absolutely minimum when it comes to protecting funds you keep on your wallet. This prevents someone who has your mobile device from accessing the coins and sending them to another wallet that they own. Setting up a PIN is a minimal requirement when it comes to wallet security. Store your recovery phrase on something that is water and fire proof All the Android hardware wallets on this list support BIP39 seed words, otherwise known as 'recovery phrases'. If your hardware wallet is lost, destroyed, or stolen, you can use this phrase to recover your funds to a new device. However, most people write down these words on a piece of paper. When their home catches fire or is flooded, they lose the device and the backup to the elements. You should therefore consider a steel backup device like the PrivacyPros Billfodl. DO NOT store a lot of coins on your Android wallet We've mentioned this before, but its worth repeating: you should treat your Android wallet the same way you treat your real world wallet or billfold. You wouldn't carry every dollar you own in your pocket. You should also not hold all your coins on your Android wallet. You need to store them on a hardware wallet. Use a VPN when transacting on an Android wallet When making Bitcoin transactions on your Android hardware wallet, it is a good practice to use a VPN. This prevents your ISP or hackers listening in on your connection from tying your IP address (and therefore your personal identity) to your Bitcoin transactions. It's a good privacy practice that is cheap and easy to implement. Below are some of our most asked questions by readers. If you're wondering about a topic on this page, odds are we have the answer here. Is Blockchain's Aqua Available on Android? For now, Blockstream's simple single-sig wallet called Aqua is not available on Android. It is coming though. For now, you will need to use Blockstream green. What is Aqua? Aqua is a single signature mobile only wallet, meaning anyone with access to your phone (either physically or remotely) could steal your coins. In exchange for the increased risk, the wallet is easier to use. Aqua is new, and if you have an iOS device, it can be a great addition to Blockstream Green Desktop. Take a closer look at it its security features and look in the video below: What is Guarda Wallet? Guarda wallet is a software wallet that was launched is 2017 for supporting for Ethereum (ETH). It is available on Android. We do not recommend it as it does not support hardware wallets. Is Electrum supported on Android? Electrum wallet is one of the most trusted crypto wallets which stores only Bitcoin. With Electrum release 4.2.1, Android (5.0 and higher) is supported. Note: While Electrum is available on Google Play, make sure to verify the installation of the distributed files using GPG signatures explained on their website. This insures that the files have not been compromised. Is Bitpay supported on Android? Yes, Bitpay is available on the Google Play Store. We do not recommend it as it does not support hardware wallets and is totally custodial, meaning you do not hold your coins. Bitpay does. Which wallet is best for investors? Investors should use a hardware wallet, not an Android wallet alone. Android wallets on their own are not very secure, so anyone holding large sums of money in crypto are advised not to use Android wallets without a hardware wallet connected. What is Exodus wallet? Exodus is a wallet that supports over a hundred cryptocurrencies. In the beginning, Exodus was originally available only on desktop (Windows, Mac, or Linux), but is now also available for iOS and Android mobile platforms as well. You can also connect it to the Trezor Model T or Trezor One hardware wallets. Jordan Tuwiner is the founder of BuyBitcoinWorldwide.com. His work has been featured in The Guardian, International Business Times, Forbes, VentureBeat, CoinDesk and many other top Bitcoin media outlets. His articles are read by millions of people each year looking for the best way to buy Bitcoin and crypto in their country.He has also written extensively about the history, technology, and business of the crypto world. Jordan is also the creator of some of the internet's most famous Bitcoin pages, including The Quotable Satoshi and Bitcoin Obituaries. To learn more about Jordan, see his full bio.
